

Thanks for your purchase of this EDIS crank position sensor mount. This is a second generation trigger mount for us here at Metal Concepts/O2Again and we hope you find the product more than acceptable. We've made changes to help improve alignment. (Pictures were not changed and the new one looks a little different). We welcome any questions, comments, or constructive criticism. We have constructed this product with top shelf material and believe it will last for many years.

You can use the included hardware to mount your crank sensor as shown in the pictures below. We use the big washer below the big hole. I don't know why Ford made it the way they did, but this was my way of dealing with their design in our application.

Thanks, Tom
